Meta Ads AI Insights Platform

Solution proposal for CEO approval

Date: 25 October 2026 | Status: Draft for decision | Working name: subject to change

1. Executive summary and decision requested

We propose to build a web-based reporting and insights platform that connects to client Meta ad accounts through a **read-only** Meta MCP connector, shows how their ads are running, and, for performance-marketing clients, reconciles Meta's reported results with the client's actual business outcomes (for example real sales and revenue) to show true ROI.

Clients get a branded, restricted-access dashboard that shows only their own accounts. We control what each client sees. An AI layer adds plain-language summaries, anomaly alerts and recommendations, but cannot change anything in Meta.

> **Decision requested:** approve (1) a 2-week discovery phase with a fixed exit review, and (2) in principle, a phased build of roughly 20 weeks to a client-ready platform, with budget and headcount confirmed at the end of discovery.

What we get

- **Transparency for clients:** one professional view of spend, delivery, engagement and conversion results.
- **Proof of value:** Meta-reported results shown next to actual sales or leads closed, with ROI and ROAS computed on real numbers.
- **Operational leverage:** less manual reporting time per client, faster issue detection, consistent client experience.
- **Safety:** read-only by design, with strict per-client isolation and an audit trail.

2. Problem and opportunity

- Meta Ads Manager is built for operators, not clients. Sharing access exposes more than we want and is hard to restrict or brand.
- Reporting today is manual (exports, spreadsheets, slides). It is slow, inconsistent and hard to scale across clients.
- Meta reports its own attributed conversions. Clients care about money in the bank. Without a side-by-side view, the discussion on results stays subjective.
- Clients with different goals (sales, leads, awareness, app installs) need different metrics, but one fixed report cannot serve them all.

The opportunity is a client-facing product that raises retention, supports performance-based pricing conversations, and reduces reporting effort per account.

3. Scope and principles

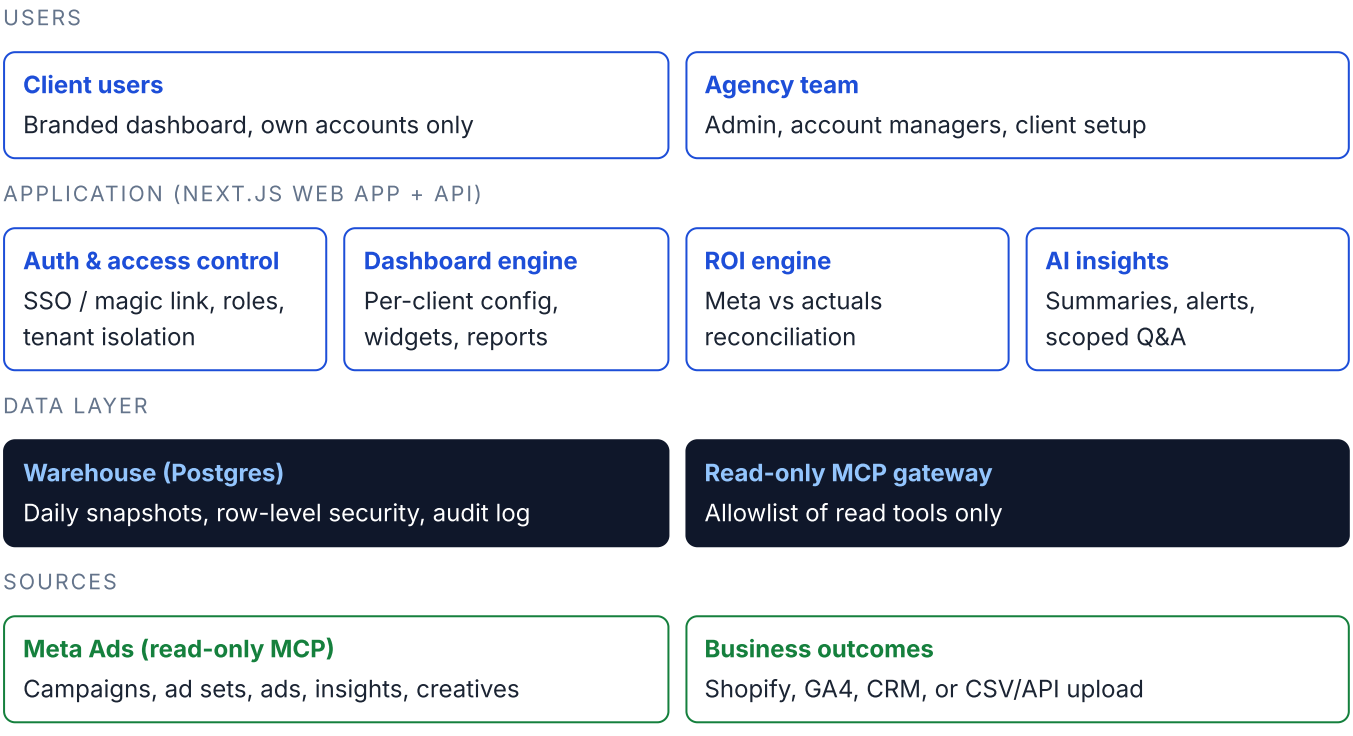

In scope	Out of scope (v1)
Read-only Meta ad account data via the MCP connector Client portal with restricted access Configurable dashboards and scheduled reports (PDF/email) ROI and outcome reconciliation using client business data AI summaries, anomaly alerts, scoped Q&A	Creating, editing, pausing or deleting campaigns, ads or audiences Budget changes or automated optimisation actions Other ad platforms (Google, TikTok, LinkedIn). The design allows adding them later Billing and invoicing

Design principles

1. **Read-only, enforced in code,** not by convention (see section 5).
2. **Every number traces to a source.** The AI explains numbers; it never invents them.
3. **Client isolation first.** No client can see another client's data, ever.
4. **Configure, do not rebuild.** New client needs are met by configuration, not new code.

4. Solution overview and architecture

The platform is a web application with a secure server component. The server is the only part that talks to Meta; browsers never receive Meta credentials.

Data flow. A scheduled sync pulls Meta data through the gateway into our warehouse and stores daily snapshots. Business-outcome data is pulled from the client's store, analytics or CRM.

Dashboards read from the warehouse, so they are fast, do not hit Meta rate limits per page view, and keep history even if Meta limits retention. Fresh-on-demand refresh is available for the latest day.

Technology. Next.js (the stack already in this repository), PostgreSQL with row-level security, a job scheduler for syncs, and the Claude API for the AI layer. The Meta connector is used as the single integration point for ad data.

5. Access control and security

> **Important:** the Meta connector exposes both read and write tools (for example create campaign, update entity, activate entity, delete audience). "Read-only" therefore has to be enforced by us, not assumed. The gateway permits only an explicit allowlist of read tools; everything else is blocked and alerts on attempt. Where possible, the Meta credentials we use are also granted read-only (ads read / insights permissions only) so a bug cannot become a write.

Control	How it works
Read-only enforcement	Tool allowlist at the gateway; read-only Meta permissions; automated test that fails the build if any write tool is reachable.
Client isolation	Every client maps to specific ad account IDs. Row-level security in the database scopes every query by client. Isolation tests run in CI.
Roles	*Admin* (full), *Account manager* (assigned clients), *Client viewer* (own dashboards only), *Client admin* (invite own users).
Authentication	SSO or email magic link with MFA option; short sessions; invite-only; expiring share links for one-off reports.
Credential handling	Meta tokens stored encrypted server-side, never sent to the browser, rotated and monitored for expiry.
Auditability	Log of who viewed or exported what, and every Meta call made. Exportable for client or compliance requests.
Data protection	Encryption in transit and at rest; no personal customer data stored unless needed for outcome matching, and then minimised or hashed; retention policy per client; compliance review for GDPR / local law before launch.
AI safety	The AI only receives the requesting client's data, has no tools that write anywhere, and answers are tied to displayed numbers.

6. Dashboard and metrics

A standard metric library covers the common needs. Each client's dashboard is assembled from it (section 8).

Group	Metrics
Delivery & cost	Spend, budget pacing, impressions, reach, frequency, CPM

Engagement	Clicks, link clicks, CTR, CPC, landing page views, post engagement, video views and hold rate
Conversion (Meta-reported)	Results by objective, cost per result, purchases, purchase value, ROAS, leads, cost per lead, add-to-cart, checkout initiated
Structure & breakdowns	Campaign, ad set and ad level; by placement, platform, age, gender, country, device; date comparison (week on week, month on month)
Creative	Top and bottom ads, creative fatigue signals, format comparison, ad preview
Health	Delivery status, learning phase, disapprovals, account errors, opportunity score
Benchmarks	Performance versus Meta peer and industry benchmarks where Meta provides them; versus client's own targets

Views: **Overview** (headline KPIs and trend), **Campaigns** (drill-down table), **Creative**, **Audience**, **ROI** and **Insights**. Every view supports date range, comparison period, filters and export to PDF/CSV. Scheduled email reports (weekly/monthly) are included.

7. ROI and outcome reconciliation

This is the core differentiator. For performance-marketing clients we show what Meta says happened next to what the client's own systems say happened.

Client goal	Outcome source	Side-by-side view
E-commerce sales	Shopify (or other store), GA4	Meta purchases and revenue vs actual orders and revenue from Meta-sourced traffic (UTM / click ID); new vs returning customers
Lead generation	CRM (HubSpot, Salesforce, Zoho) or sheet upload	Meta leads vs qualified leads vs closed-won deals and their revenue; cost per qualified lead and per sale
App / other	MMP, backend API, CSV	Meta installs vs verified activations or purchases

Headline ROI measures

```
True ROAS = Actual revenue from Meta-sourced orders / Meta ad spend
ROI % = (Actual revenue - COGS - Ad spend - Other campaign costs) / Ad spend x 100
CAC = Ad spend / New customers acquired
Attribution gap % = (Meta-reported revenue - Actual revenue) / Actual revenue x 100
Blended ROAS (MER) = Total store revenue / Total ad spend
```

Example for a sales campaign: Meta reports 420 purchases and 38.0 lakh of purchase value on 9.5 lakh spend (ROAS 4.0). The store shows 355 matching orders and 31.2 lakh revenue (true ROAS 3.3), and after product cost the client sees ROI of about 38%. The dashboard shows all three, plus the gap and a likely explanation (attribution window, view-through credit, returns or cancellations). *Illustrative figures only.*

Honesty about attribution. The two sources will rarely match exactly. Meta uses its own attribution windows and modelled conversions; clients' systems use different rules. The platform shows both,

labels the method, and lets the client choose the lens (Meta-attributed, last-click, blended). This builds trust; hiding the gap would damage it.

8. AI insights and per-client customisation

AI layer

- **Plain-language summary** each week: what changed, why it probably changed, what to look at.
- **Anomaly alerts:** spend spikes, CPA jumps, delivery drops, creative fatigue, budget under- or over-pacing.
- **Recommendations** for the account team to review and pass on (the platform itself takes no action in Meta).
- **Ask a question** chat scoped to one client's data, for example "why did ROAS fall last week?"

Guardrails: numbers are computed by the platform and passed to the AI; the AI explains them and cites the metric and date range. Insights are drafted for account-manager review before client release at first, with a switch to auto-publish per client once trusted.

Customisation per client

Setting	Options
Template	E-commerce, Lead gen, App, Awareness, or custom
KPIs and widgets	Choose from the metric library, order, size, hide/show tabs
Targets	Client targets (ROAS, CPA, budget) drive colour-coded status and alerts
Outcome connectors	Which store, analytics or CRM is linked; attribution lens
Branding	Logo, colours, custom domain (white label optional)
Locale	Currency, time zone, language, date formats
Reports	Schedule, recipients, sections, AI commentary on/off
Access	Which ad accounts, which users, which views and export rights

9. Phased roadmap, team and cost

Phase	Duration	Deliverables	Exit gate
0. Discovery	2 weeks	Confirm connector terms and multi-client use with Meta; pick pilot clients; define metric library and ROI data sources; final architecture, budget and plan	CEO review; go / no-go on build
1. Foundation + MVP	6 weeks	Auth, roles, client isolation, read-only gateway, data sync, Overview and Campaign views, PDF export; 2-3 pilot clients	Pilot clients view live data; security tests pass

2. ROI engine	6 weeks	Shopify / GA4 / CRM / CSV connectors, ROI view, attribution gap, targets and alerts, scheduled reports	Reconciled numbers match client's books within agreed tolerance
3. AI and scale	6 weeks	AI summaries, anomaly alerts, scoped Q&A, template library, branding, onboarding flow for new clients	Roll-out to full client base

Team (indicative)

1 product owner (part-time), 2 full-stack engineers, 1 data / integration engineer, 1 designer (part-time), 1 QA / security reviewer (part-time), and an account-manager lead from the marketing team for pilot feedback.

Cost

Exact figures are produced at the end of Phase 0, when scope and client count are fixed. Cost categories: team time (the largest item), cloud hosting and database, Claude API usage (scales with client count and insight frequency), third-party connector or SSO fees, and a security / privacy review. Running cost is expected to be small relative to team cost and grows with number of clients.

10. Risks, assumptions and open questions

Risk	Mitigation
Connector terms or limits do not allow server-side, multi-client use	Verify with Meta in Phase 0; fallback is Meta's standard Marketing API with the same read-only design.
A write tool is reachable by mistake	Allowlist gateway, read-only token scopes, CI test that fails on any reachable write tool.
Data leaks between clients	Row-level security, isolation tests, audit log, external security review before launch.
Meta and client numbers disagree and erode trust	Show both, label methods, explain gap, agree attribution lens with each client at onboarding.
Meta rate limits, token expiry, API changes	Warehouse snapshots, back-off and retry, token health monitoring, version pinning.
AI states something wrong	Numbers computed by platform; AI cites sources; human review before release by default.
Clients' outcome data is messy or unavailable	CSV/API fallback; data-readiness check in onboarding; ROI view marked "Meta only" until linked.
Privacy law / client contract constraints	Legal review in Phase 0; data processing terms; minimised personal data.

Assumptions

- We have, or can obtain, client authorisation to read their ad accounts.

- Clients can give access to at least one outcome source (store, analytics or CRM).
- Meta ad data is the only ad platform in v1.

Open questions for the CEO

1. How many clients should the platform support at launch and in 12 months?
2. Is this an internal service for clients, or also a sellable product (affects white-label and pricing)?
3. Which 2-3 clients should be pilots?
4. Budget ceiling and target launch date?

Success measures

- Pilot clients using the dashboard weekly after 4 weeks of access.
- Manual reporting hours per client reduced by at least 50%.
- Zero cross-client data exposure and zero write calls to Meta, verified by audit.
- ROI view reconciled to client's own figures within an agreed tolerance for pilot clients.

11. Approval

Decision	Approved / Not approved / Approved with changes
Phase 0 discovery (2 weeks)	
Phased build in principle (about 20 weeks)	
Comments / conditions	
Name, signature, date
